

New design commercial fleet

Respraying its commercial vehicles is not an everyday affair for a company like Bolidt. Renewing their design even less so. Yet, a start has been made with the renewal of the company fleet.

Bolidt's first commercial vehicle was a type T2a Volkswagen pickup van from 1967. The application team drove this van all over the country to install the synthetic materials in many projects like the gas desulphurization installation of the P.G.E.M. in Nijmegen, the Hem Bridge in Amsterdam and the [Athletics track](#) in Utrecht.

Over the course of time the appearance of the application van has slowly changed. From the eighties onwards, the orange van has become part of the landscape. Wherever you drive you are bound to see one of these striking vans.

At the start of the 21st century it is time for a new design. The double cabin LT46 Volkswagen will be given an even more striking appearance than before. The colour of the vans will remain as it is, so that you still will be able to easily recognize a Bolidt application team. Through the years, all company vehicles will undergo this metamorphosis.
