

## Follow the milk and discover Bolidt

[Campina](#) processes about 3.3 billion kilos of milk a year in the Netherlands. This makes the Netherlands the main production base for Campina. The company is especially known for its daily fresh milk and desserts. It has offices, factories and warehouses throughout the country.

The flooring in Campina's [warehouses](#) is subjected to very heavy loads. Pallet movement and forklift traffic are the order of the day. One of the warehouses is located beside the Veghel office.

Over the years, the asphalt in this warehouse has started to cause problems. The more or less open structure of asphalt makes it impossible to prevent dust from accumulating on the floor. In addition, Campina's customers have been setting increasingly critical requirements.

This compelled Campina to look for another flooring solution. The company examined various flooring systems, but most alternatives presented problems like differences in level and a long drying time.

The options also included a synthetic floor finish. Campina was already familiar with the [Bolidtop](#)<sup>®</sup> systems, because they are used in some of their other locations as well. The Bolidtop<sup>®</sup> 300 system can withstand heavy forklift traffic and has a well-sealed surface. The Bolidtop<sup>®</sup> 300 system also bonds to the existing asphalt. This prevented Campina from having to incur the high costs involved in removing the asphalt.

Finally, the yellow lining was applied in order to indicate clearly where the pallets should be placed, so that the warehouse can be kept organized and tidy!
